

Bogotá, May 26, 2026

Dear Professors Adena, Fossen, and Neyse,

We are pleased to submit our manuscript, "Coding open-ended responses with large language models: Evidence from three economic experiments," for consideration in the special issue on Advancing Reliability in the Social Sciences: Meta-Science, Transparency, and Crowd Research.

The paper addresses an underexamined problem in experimental economics: the reliability and replicability of text coding. Transforming free-form participant responses into structured variables typically depends on human research assistants whose decisions are discretionary and often undocumented, creating a source of analytical flexibility that existing transparency standards do not address. We ask whether large language models (LLMs) can code open-ended experimental text with sufficient reliability to substitute for, or complement, human coders, and whether LLM-generated codes support the same substantive conclusions as the original studies.

We believe this contribution fits well within the scope of the special issue, particularly its emphasis on reproducible workflows, open science practices, and methodological meta-science on reporting standards.

Thank you for your consideration.

Best regards,

Daniel Parra
